

Blue Dots.

Add green squares.

Color changing.

Reflection Points:

- **Selections**
 - What I found difficult initially about understanding how selections work was in terms of how exactly the selection operator grouped elements of the document and how exactly an empty selection can be used as a container for future elements. It was only after seeing the pattern in practice that it made sense to me.
- **Data Binding**
 - Data binding was slightly confusing for me to understand in terms of when a data stream was read. Initially I had a mental model where within javascript was a purely linear process but once I read a little bit on how data binding takes place, I saw it not different than a preprocessor file in languages like C++.
- **Data Streams**
 - While the act of binding to one data stream was easy enough for me to understand, it was the act of utilizing more than one stream and when to switch sources that was confusing.
